## cEBRIR factory-produced components...

 MODULARCOMPONENTS

> The Gebrik Insulating Brick Cladding System is a factory-produced external walling system consisting of panels, corners, fixings and associated components.

Designed to create a lightweight, natural brick appearance, Gebrik insulates and protects a building from water penetration and is siteapplied to buildings constructed of masonry, timber, steel frame or SIPs to clad new buildings or refurbish and protect existing buildings.

The composite panels and corners comprise of $15-20 \mathrm{~mm}$ thick frost-resistant, clay brick slips, cast in polyurethane insulation and are supplied in Stretcher, Stack, Flemish or other bond formats. There is a range of approx 700 different brick choices in a variety of finishes and sizes; samples and details of which are available upon request. Alternatively, non-standard brick finishes can be developed subject to quantity and agreement with the manufacturer.

Gebrik's insulating properties will help to significantly improve a building's thermal performance (it is proven to reduce a building's U-value by up to 60\%) and keep wall thickness to a minimum. The insulating material is polyurethane (PUR) and uses pentane as its blowing agent and therefore does not release CFC or HCFC agents during manufacture. The PUR has a BREEAM element number of 815320017 and Green Guide rating of A.

## Gebrik Panels

## External Corners

Corners are factory-produced by cutting and bonding flat panels with PU §lue (coloured to tone with the brick face). Excess glue is removed mechanically at the factory and the corner when viewed from 3 m is consistent in colour and flatness. The length of either side is a multiple of full and half bricks up to a maximum of $21 / 2$ bricks. Note that where bricks are cut, they will naturally reduce slightly in length and will also vary in dimension subject to specific brick type. Care should therefore be taken when producing setting-out drawings and when preparing the substrate on site. Alternatively, corners can be factory- or site-produced by applying brick slips and brick slip 'pistol' returns to L-shaped PU foam.

Please contact our Technical Department for project-specific guidance if required.

UK Format

## Jambs

Type FE \& RE Jambs are produced in the same way as other corners, with leg dimensions typically in multiples of full or half bricks up to a maximum 2112 bricks long. One leg should produce a castellation with the adjoining (upper/lower) leg to maintain the bond pattern and the other leg to suit the depth of reveal.

Please contact our Technical Department for project-specific guidance if required.

UK Format

## Heads

Type HE \& RE Heads are produced in the same way as other corners and typically suit brick coursing. It should be noted that the underside is produced from a multiple of 65 mm coursing and the mortar joint is positioned centrally unless requested.

Care should be taken when applying slips to the underside and should be firmly anchored with temporary fixings \& washers whilst the adhesive cures. Alternatively, consideration should be given to only using cast slips, e.g. HE3-3R@3 or HE3-3S@3.

Please contact our Technical Department for project-specific guidance if required.

## Size matters

We recommend that these brick dimension tables are used during the design stage to avoid cut bricks. The tables are based on the British Standard Co-ordinating size of $225 \mathrm{~mm} \times 112.5 \times 75 \mathrm{~mm}$, which includes 10 mm joints (this size being determined by the term CO). Please consult our Technical Support team for guidance on bricks with other dimensions.

## Metric <br> Coordinating Dimensions

## C- : C minus joint

CO : Coordinating size
C+: C plus joint
